Dawid Wozniak:

OK, so let's start with some information here. We have the iteration on the board, and you can see that we are on the 2nd iteration and you participate in the first iteration. That's good and here I focus more on the functionality here, and I focus more on the UI now, and then I will focus more on the functionality in the third iteration and there would be a four iteration that would be like final iteration. When we compare the version with the commits and without the commit history, so how do you basically like it then. We still have some problems with the scalability. So, for now we just analyse 5000 latest comments. So today actually, I'm going to show you some report that you sent to me, and I will focus on that. I've been thinking how it looks like so yeah. So now, if we are here, and you have some images, we can go to one of this bubble and then you have a slightly different view. So here you also have like the icon saying that it is a new commit. It is not the new line as it used to be. And then we have the commits there in the separate tab. So here we have some filters that you can apply. So, one is just search for the part of the commit message. Let's say that here I just want to search for "add" and then you can see that there is this commit. You can show or hide merge commit messages, but actually you don't have that much commit messages here but you can still filter there by author and by date and so if you don't know the author, you can just go to the top contributor metrics here and then you can see okay there is Paulina and then you can just put Paulina, you will see all commits that were done by you. I think that's all, so it is basically the first separate commit view and what do you think about this? Is tab view better than the previous view?

Paulina:

Yeah. So, I think that it's better that it used to be, but it's still like not that UI friendly, so here I can see that the list is quite long, and I have some other like things… that I cannot resize it really. Right? Yeah. So, I think that it's better, it's nice, not nice in context of this, you know, like user experience that it's so small comparing to all these things and maybe I wanted to make them smaller. It should be like collapsible like these filters maybe I should be able like to move them or to collapse them. So then, if I don't use them, they are just simply gone. I also think that it's not good to show it to someone who has some disability, like, you know, we want to be friendly for all people who have some, like screen readers or whatever. Then I can see that it's probably difficult for it to process it. So, I think maybe this detail banner should be somehow like attach view or a pop up maybe with these commits. I don't know, I just have these ideas that maybe or if not the pop up. then you can basically maybe move it below this visualisation then I can scroll all the visualisation. You can actually make it in some other form. Let's say that it can be something like the list or whatever you think might be like, you know, list when you can also attach this information. I think it would be better.

Dawid Wozniak:

Yeah. I thank you for that feedback. That's very nice. So now you can see that we have these messages and we have also the description of it. So, in the pull request, when you have something like this or, you don't use pull request, right?

Paulina:

Yeah, yeah.

Dawid Wozniak:

But if you do, then you have some like merge commits with the description and then you have it here and you have access to this information. So, if you think about that, do you think that it beneficial to create like the tag cloud based on this commit messages and commit description?

Paulina:

So, can you show me the example of the teg cloud what you mean here?

Dawid Wozniak:

Yeah, yeah. Just give me a second. I will find something here. Let's type me in Google. Yeah, so it will. It will be something like this. Yeah. So, then you have the word that occurred many, many times. It's the biggest one. And then when you have some word that occur once, then you can have like, the small text here.

Paulina:

Yeah, I think that it would be nice for marketing purposes. I can see usage of it, but it would be nice for me to actually maybe generate that. Then I can see which changes were made and then I can show it to some group and say, OK, it is what we change in the last 100 commits, but it would need to be another project. It should not be those images because it is just internal to be something that should be like open project to everyone and they contribute, they wanted me to present some value or some changes and then I can maybe think about this when those messages have a good quality and I'm not sure that they always do. But yeah, I guess that it depends on the person who writes them.

Dawid Wozniak:

Yeah. And if you think about this current filtering is it's useful for you or it's not useful?

Paulina:

I think that sorting here, so you have basically like the date always. So maybe you would have more than that and then you can also like hide those filters. Maybe it should be sorted in another way, so it's easier like to use this arrows and go like at Amazon something like. You know if you open the Amazon or some other shop then you would have this. I think that it's nice.

Dawid Wozniak:

It's nice idea actually to have this. That's a nice suggestion. And then, when you think about this, insights, that commit history, would you like to have something more here?

Paulina:

That's difficult to answer. Yeah, maybe some don't know highlighting of this when I type here like "add". Maybe you should also be highlighted here in the message when the message is long then it's not that visible. Yeah. So, I think that might be the change.

Dawid Wozniak:

Okay. And is there anything else that would like to say about this?

Paulina:

No, no, actually there is no. So, I think that it's enough, it's OK to have it like this, maybe you should actually think about that this accessibility stuff. And the other thing that I mentioned, but generally I think that it's nice, it's just that the problem that yeah, you think about the UI how to make it more friendly for the, for me maybe you something different thing about like hiring the UX UI specialist so they can help you with that. I'm pretty sure if you want to, I can give you a contact to really nice people who can help you with that. They are not that expensive.

Dawid Wozniak:

Hmm. Yeah, OK. I think that it's nice that you said that. I will try. So, thank you one more time for participation. That will be another first round and forefront of this feedback and then I will talk with you again. So, thank you one more time and see you next. And now I will stop the transcription right now.
