Dawid Wozniak:
Today, we have like a summary and what was done. So. since the last version there is not that much change. So, I will just describe what I did. Here when we select any commit and get to the details, now in the commit view, you can also search in the description. So, let's say, that I will search for some „fix" and then maybe I'm not satisfied with these results, so I can put also the tick. OK, tell me if this also in the description. So, then the list is longer, some people might, for example, here you don't have „fix" in the title, but when you open it is in the description. It's like „fix breaking changes" in something. When I show the edited files, it used to be just displayed on the visualisation, but now we will also get a list of all files here, so when it's done, we supposed to get the list there. It's supposed to give you a better access to all these files. Maybe it should be somehow also improved in the future. Yeah. So here you cannot see what we just highlighted because we have so many files. So, you can just follow this list and see, OK, so maybe, I'm interested in just marketing stuff. So, then I will go to the marketing. I can find them somewhere there. So, you've seen this product a few times during our meetings. So, do you think that it improved overall since the first version?

Blazej:
Yeah, it is definitely looks more mature and more features added and it, kind of, looks more useful for anyone who needs to analyse code changes.

Dawid Wozniak:
If you put it on the scale from zero that it's basically like nothing changed for you in context of this product to ten that is fundamental change that we add this new tab about commits and all feature another here. What number would you give talking about changes?

Blazej:
It's not about the right product, just commit stuff?

Dawid Wozniak:
A few times you see this product and now we improve this. So, in the scale from zero to ten, how would you grade the improvement? If it's zero, it is like...

Blazej:
Ohh, let's give it eight.

Dawid Wozniak:
OK, that's nice. I asked you during the first meeting when you have just this general view with the list of commits that used to look something different, but it was similar idea. It was informative. So now, I'll repeat this question. So, if you have the statement that information about commit messages is presented in the clear and easy navigate UI, what grade would you give from zero that is like completely not usable to ten that it's like perfect, nothing to add, nothing to correct for you.

Blazej:
Nine. It is very clear.

Dawid Wozniak:
OK, so those two questions were more focused on the commit part, but now I have a general question about this product with my changes. So how beneficial would it be for you to use this product also from zero to ten. Zero - you will never use it outside of this meeting to ten that if you have a chance, you will use it everyday multiple times a day.

Blazej:
So as I explained earlier, I'm not looking at code and changes commits on a daily basis, right? That's

why. If I say that I would not need to use this product everyday, that doesn't mean it's useless. It's just because my role is different. I think it's quite useful. It might be quite useful for people who are looking for what has changed and why. So, so for some people, even thinking about our team and being on all call, sometimes it might be quite useful to see that. So, I am pretty sure that, maybe you know a couple of times a week someone needs to find something specific, you know, look, investigate and look for changes and then this is quite useful, yes. You need the scale… so probably from zero to ten…

Dawid Wozniak:
I understand that you will not use it maybe often because you don't need that information, but maybe it's useful for some scenarios.

Blazej:
So yeah, I think it is very good. I would give it like an eight, probably for developers. Scenarios were more specific when someone is looking for change. What changed? What caused that given change? What was that change? Which files were touched? Yeah. So, I think in our project, it is now testing on our product. It's not really representative for the industry, it's probably too big. I mean not saying too big for this tool, but majority of software projects that are out there are smaller, I think. And so, this is… even the visualisation would be more like, you know, easy to understand, because sometimes as you said, right, sometimes it is difficult to spot like those little circles. When you have a smaller project then it's easier to find what's it going on.

Dawid Wozniak:
OK. Regarding this commit message history out there, do you think that there is something still missing that you would like to have something that you think that would be nice, but it's still not there? Something that we can do, in the commit view or in the general product using this information.

Blazej:
No, nothing comes to my mind, especially even now that, I'm, kind of like, I'm not using this right now. I can have some as I mentioned to you before this kind of related improvements but that's like, for instance, like looking at this maybe filtering should be the first step and sorting the second one because that's like for me it's the very cool important part that I can find and filter. Then, sorting is kind of a secondary option on the top of what I have searched. But also like for instance if you switch to sorting, you have the descending and ascending huge buttons where it could be some small icons next to the field, stuff like that you know. So, they have more space for something else. Yeah, but I think, it's OK really. It has a lot of functionality now.

Dawid Wozniak:
OK, so it was my last question, but now it's time for you. So, if you would like to say something about this or about the product, it's time for you. If not, then we can finish that that meeting.

Blazej:
Yeah, I think I don't have that much to add but I think it might be beneficial for you, I think I mentioned that last time I remember is to think about this branding because even here now you have this „help improve Git Truck" on the left side, which is the second panel next to the information about my repository and still there is nothing. Nothing that says this is Git Truck. You are in Git Truck. So maybe, that's something, you could, you know use this panel for like „hey welcome to Git Truck" or whatever. To help improve, it is just an option.

Dawid Wozniak:

I think that it is something that we would like to do with other people who are interested in Git Truck and yeah, but I didn't do that because of the time limitation.

Blazej:

So, I think it might be nice to kind of have this. Then, you have this another thing that I noticed, you have to search for file and folder here which is different than searching through the commits, right? I understand that here you just search for some file.

Dawid Wozniak:

Let's say you know that there is a file named something, but you don't know where exactly. So, you can just type it here and you can find it.

Blazej:

So that, it might also, you know, have some form of link or something. If you want to search for commits or search in commit, because this is like a search experience, and it is prominent, right? Then you can say, you know, open this commit or filter by it, because then you can still search. Now, you're searching within commits…

Dawid Wozniak:

I mean searching for files and filtering are two different concepts, but I think about that because they are consensually similar, right?

Blazej:

Yeah.

Dawid Wozniak:

Thank you for your participation.
